

How to login webmail

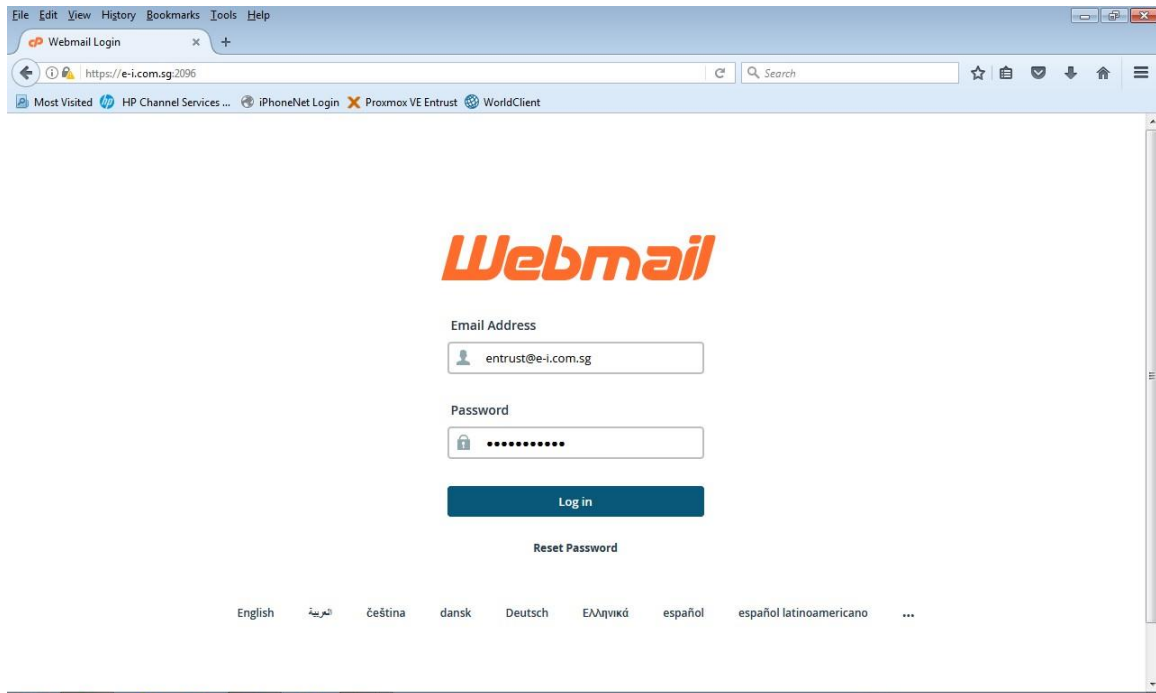

Date: July 2017. Documented by Stephen

Open internet browser, go to <https://yourdomain.com/webmail> (**your domain refers to the email domain example yahoo**)

Email address: username@yourdomain.com (**your own email account**)

Password: XXXXXXXX (your secret password)

Click “Log in”

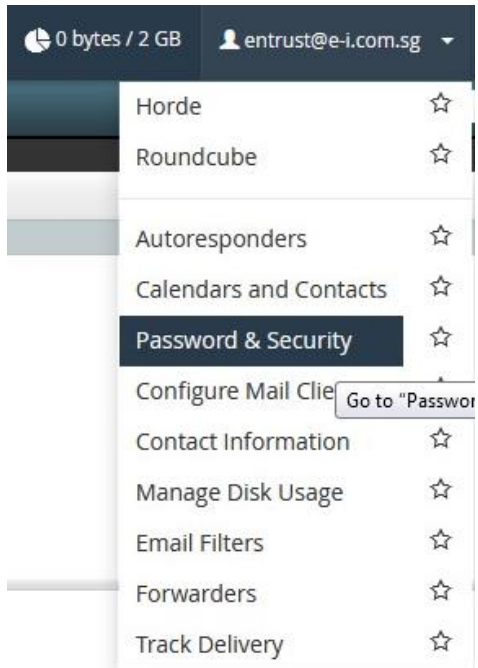

How to change email password

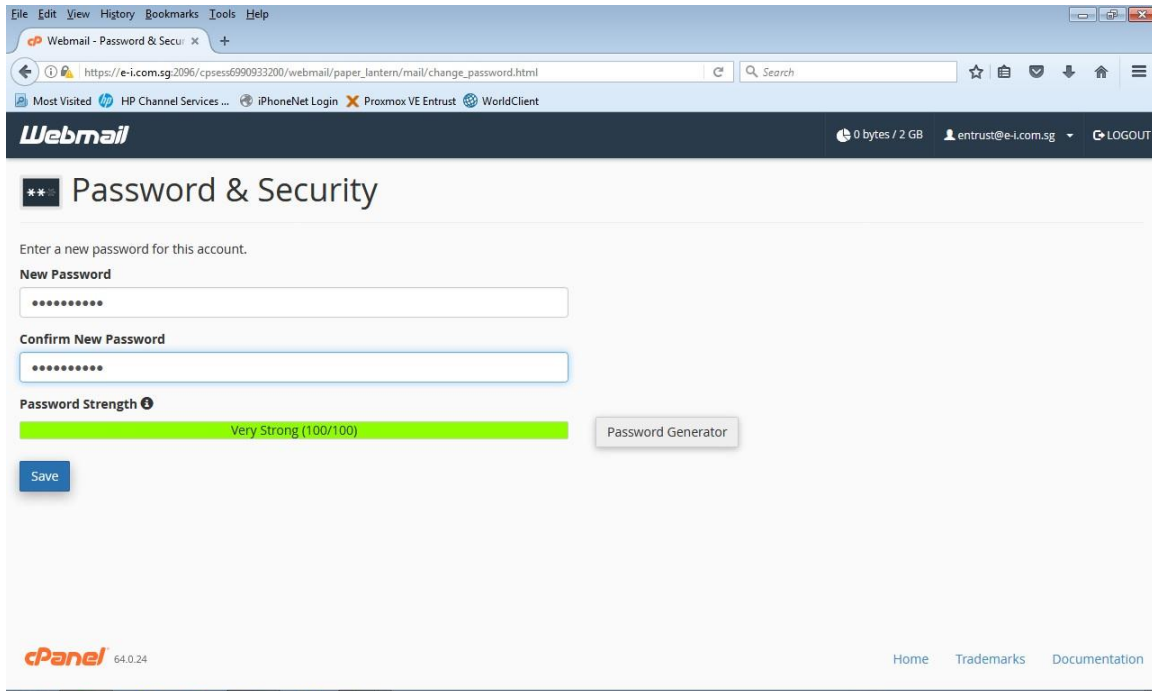

There are 2 webmail interfaces available for use.

If you are using **horde webmail**,

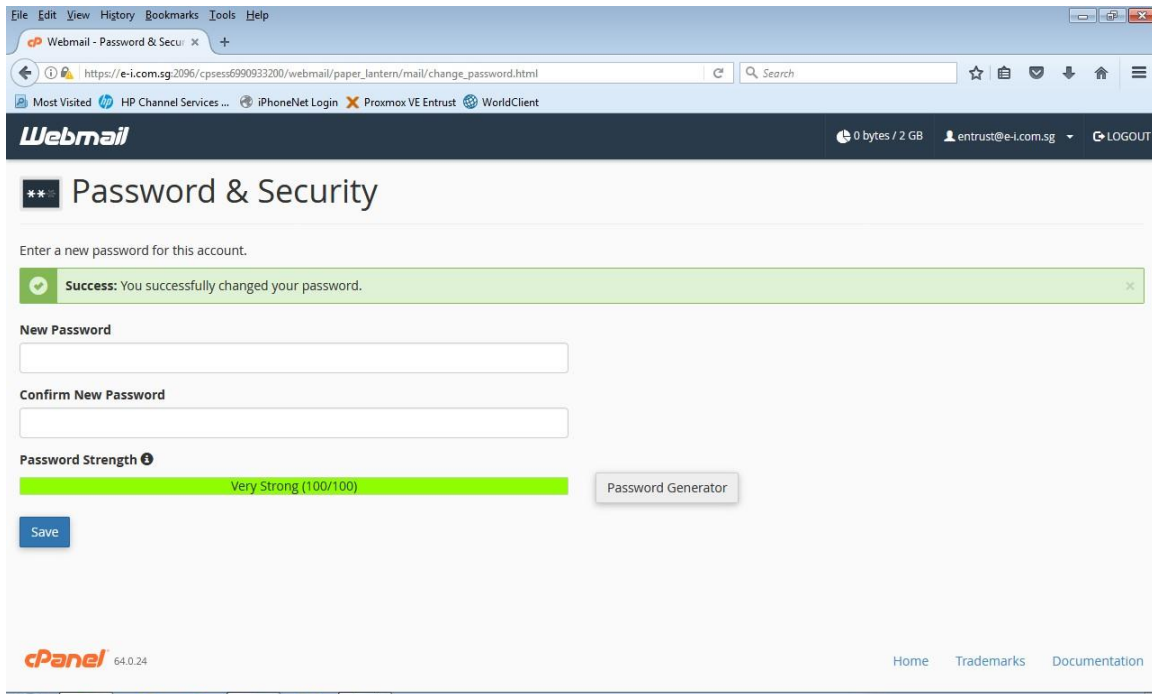

Click the username → go to “Password & Security”

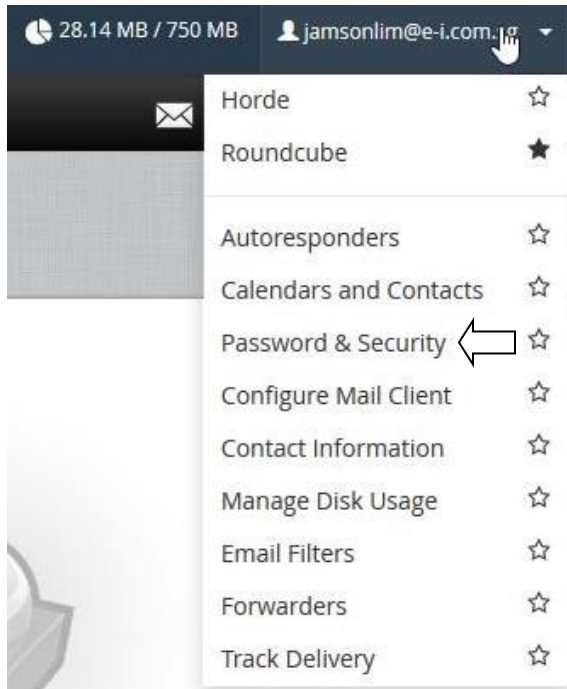

Enter your password. We highly recommend that the password is much more complex which consists of at least 8 alphanumeric characters. A combination of upper case, lower case, numeric digit, and symbol. It is best that you create your own password rather than you generate the password. Once you have entered a password in both fields. Click Save.

Once you click save it will show you that your password has successfully changed.

For Roundcube webmail

Changing the password is the same. You just click **Password & Security**. There you can change your password.
